

a 2008 0130

The invention relates to parasitology, in particular to the hen prophylaxis and treatment against ectoparasites and can be used in the veterinary medicine.

The method includes treatment by hen spraying with a 5% aqueous extract obtained for the aboveground parts of dry tobacco (*Nicotiana rustica* L.), in a dose of 50 ml per hen. For prophylaxis the treatment is carried out once, and for treatment – twice, with an interval of 14 days.

The result of the invention consists in increasing the efficiency of ectoparasitosis treatment to hens.
