The invention refers to the dairy industry, namely to a process for whey processing.

The process for whey processing includes cooling of whey up to the temperature of 5...10°C, electroactivation of whey in the cathodic chamber of a membrane electrolyzer with ion-selective cationic membrane, at a current density of 10,0...20,0 mA/cm², with feeding into the anodic cell of a calcium ion solution with the concentration of 1...2%, collection of the obtained foam and separation of the proteomineral concentrate from the deproteinized whey containing lactose and lactulose.
