The invention relates to the feed industry and can be used for additional feeding of wild artiodactyla.

The additional feeding is carried out in December-March with fodder prepared from chopped grass hay, harvested before flowering or in the flowering period and sweet beet pulp with a humidity of 70...75%, placed in layers with the thickness of 25 and, respectively, 10 cm, and iodated salt, taken in the following ratio, mass %:

chopped hay	9.5...10
sweet beet pulp	89...90
iodated salt	0.5...1.0.
