

a 2003 0276

The invention refers to medicine, namely to traumatology and orthopedics and is meant for restoration of the distal tibiofibular syndesmosis.

Summary of the invention consists in that the device is made in the form of a plate with rounded edges, one end of which is made in the form of a hook. In the opposite fixing end of the plate there is made a groove under the regulating screw and an orifice under the fixing screw, and between them it is installed a disk eccentric with a recess under the regulating screw.

The result consists in increasing the reliability of fibula fixation, in simplifying the device modeling according to the anatomical peculiarities of the patient and in preventing the friction corrosion appearance.
