

The invention refers to medicine, in particular to the mammary gland oncology.

Summary of the method of subtotal mastectomy in the mammary upper dial cancer consists in that there are made two incisions, the first begins from the medial margin of the mammary gland at the mamilla's level, forming an arc onto the lower margin of tumor, up to the medial margin of areola, then it is continued onto the upper margin of areola up to its lateral margin, afterwards it is continued up to the middle axillary line 5...6 cm below the apex of the fossa axillaris. And the second one begins from the same point from the medial margin of the mammary gland, forming an arc at the level of the tumor upper margin and it is continued up to the joint with the first incision in the axillary region. It is partially removed the mammary tissue with the tumor in a single block with the subclavicular and axillary lymphatic collectors, then it is carried out plasty of defect by suture of flap margins to the fundus of wound which is actively drained.
