The invention relates to medicine, particularly traumatology.

Summary of the method for treatment of pseudoarthrosis includes administration of a morphoinductive preparation. Within a month after administration of the morphoinductive preparation it is carried out the radiography and if it is determined a fibrous tissue resorption process, then it is appreciated a favourable evolution of the osseous reparative regeneration. In the case when is not determined the fibrous tissue resorption process, it is carried out the repeated administration of the morphoinductive preparation. At the same time, as morphoinductive preparation is used osteomedular cell culture or demineralized bone matrix.
