The invention relates to experimental medicine, regenerative medicine, in particular to an immunological method and can be used for diagnosis of experimental pemphigus-like lesions in rats.

Summary of the invention consists in collecting blood from the caudal vessels of rats, centrifuging and determining the concentration of the complement components C3 and C4 by the optical method in the ultraviolet wavelength range, and in the case when the concentration of C3 is 1.02...2.54 g/l, and C4 - 0.82...0.94 g/l, experimental pemphigus-like lesions are diagnosed in rats.
