

s 2019 0084

The invention relates to the protection of hunting fauna, in particular wild boars populations, and can be used for their deparasitation both in nature and zoological gardens.

The composition for deparasitation of wild boars comprises, in %: corn - 27.3, soybean groats - 15.6, sunflower-seed cake - 15.6, barley - 10.0, protein-vitamin-mineral premix for pigs - 2.5, roasted *Amaranthus retroflexus* seeds - 4.0, a preparation containing 20% of albendazole - 0.3, dextrin - 12.2, bentonite - 12.5.

The process for deparasitation of wild boars provides for the administration of said composition in the form of briquettes, in a dose of 1600 g/head, in the winter period, twice with a 14-day interval, with the briquettes placed in the pre-arranged feeders.
