s 2020 0030

The invention relates to medical equipment, in particular to a device with beveled end for implantation of antiglaucoma shunt, and can be used in ophthalmic microsurgery for surgical treatment of patients with glaucoma.
Summary of the invention consists in that the device comprises a shunt inserting mechanism and a fixator, which are made of medical photopolymer; the mechanism contains a cylindrical handle, rigidly fixed to the working end in the form of a hexagonal prism, on one of the lateral sides of which is made an annular cutout with a continuation on the end side of the working end by means of a groove with a depth of 0.7 mm, and the said end side is made beveled at an angle of 45°; the handle is made with a bevel with a continuation on the lateral side of the working end, on which the cutout is made; the fixator is made in the form of a tube, embracing the cylindrical handle, the inner surface of which is congruent with the outer surface of the cylindrical handle, with the possibility of sliding along it, and on the outer surface of the tube are made notches, at the same time the tube of the fixa-tor is equipped with a cover for covering the lateral side of the working end, on which the cutout is made.
