

The invention relates to fish breeding, namely to a mobile plant for breeding pelagophilic fish and can be used for industrial breeding of pelagophilic fish in the conditions of rivers and lakes.

The plant, according to the invention, comprises a floating dock, equipped with a trashrack (6) and submersible direct-flow pumps (30), wherein are placed a spawner capture system, a fish spawning system, and a spawn collection and incubation system. The spawner capture system consists of a spawner collecting compartment (18) and a spawner moving device in the form of a net trap, and is equipped with physical radiation sources (24). The fish spawning system comprises a cylindrical pool (25) with a conical bottom (26) and with a central drain hole, wherein is fixed a vertical perforated drainpipe (28), and the spawn collection and incubation system comprises a rectangular pool (38), equipped with a pump (41), wherein are placed in rows spawn collection and incubation tanks (42), connected by a vertical pipe to horizontal drainpipes, connected to the drain hole of the cylindrical pool (25).
