

96-0360

The invention relates to the electromeasuring technics.

The summary of the invention consists in the fact, that the simulator contains two current clamps and two current potential terminals as well a controlled voltage divider. The resistance box with digital control, the third current clamp, the third potential terminal and a microprocessor system of control, treatment and indication of the information are introduced into the device, and the controlled voltage divider is executed as two scaled multivibrators-transfers series connected.
