

a 2005 0087

The invention refers to agriculture, namely to the apple-tree treatment and may be applied for increasing the number of fruit buds.

The process, according to the invention, includes the extraroot treatment of the trees within 2 weeks after flowering with 0,15% aqueous solution of 3,5-dioxo-4-propionylcyclohexanecarboxylate of calcium, the total consumption being of 800...1000 L/ha.

The result consists in intensifying the processes for fruit bud formation in the vegetation period.
